PROJECT SUMMARY

Buimo Road Early Learning Phonics School (BRELPS) Website

1. Website Purpose

The website is developed for **Buimo Road Early Learning Phonics School (BRELPS)** to establish a professional, informative, and accessible digital presence. It serves as an online platform to communicate school programs, fee structures, enrollment guidelines, and contact channels for families and community members in Lae, Morobe Province.

2. Target Audience

The primary target audience comprises parents, guardians, and local families seeking quality early childhood education, play school, pre-school, and early primary education (Grades 1 and 2) for young learners. Secondary users include school administrators and community stakeholders looking for institutional information and enrollment forms.

3. Main Website Features

- **Semantic HTML5 Architecture:** Utilizes clean structural tags (<header>, <nav>, <main>, <section>, <article>, <footer>) across a connected multi-page layout (index.html, services.html, contact.html).
- **Custom Responsive CSS3 Design:** Styled using Flexbox for header and navigation alignment, and CSS Grid (.grid-container) for flexible multi-card layouts that adapt seamlessly across mobile, tablet, and desktop viewports.
- **Structured Data Tables:** Presents clear, organized tabular data detailing school grade levels, target age brackets, and termly fee schedules in Kina.
- **Accessible Forms:** Features structured inquiry and registration forms organized with fieldsets, legends, and explicit labels.

4. JavaScript Functionality Implemented

- **Interactive Program Table Filter (services.html):** Allows users to click filter buttons (*All Programs*, *Play School*, *Pre-School*, *Grades 1 & 2*) to dynamically display relevant table rows without reloading the page.
- **Client-Side Form Validation & Feedback (contact.html):** Intercepts form submissions to validate required fields (parent name, phone number, and student name), prevents empty submissions with interactive alerts, and displays a dynamic success banner.

5. Testing Performed

- **Functional Testing:** Verified internal navigation links, button states, filter responsiveness, and form submission validation flows.
- **Responsive Testing:** Evaluated layout adaptation across mobile (~320–480px), tablet (~600–900px), and desktop viewports using browser developer tools.
- **Accessibility & Quality Assurance:** Checked semantic correctness, keyboard focus outlines, color contrast, and image alternative text.

6. Known Limitations or Future Improvements

- **Limitations:** The contact form currently operates via client-side JavaScript validation and success feedback without a live server-side backend or database connection.
- **Future Improvements:** Future iterations could incorporate server-side script processing (such as PHP or Node.js), automated email dispatch, and local storage integration for user preferences.

7. AI Use Declaration

- **AI Tool Used:** Gemini (Google AI)
- **Extent of Use:** AI assistance was utilized to help structure the JavaScript table filtering and form validation logic, troubleshoot CSS layout spacing, and assist in drafting technical documentation and project summaries.
- **Student Responsibility:** All code snippets, markup structures, and styling configurations were manually reviewed, tested across viewports, and integrated into the final codebase by the student.
